

MANNESMANN REXROTH	Hydraulic Motor (Radial Piston Multiple Stroke) Type MCR 15, Series 3X				RE 15 208/10.94 Replaces: 15 217
	Size 1130 to 2150	to 450 bar	to 2150 cm ³	to 13688 Nm	

Characteristics:

- compact, sturdy construction
- smooth running even at very low speeds
- low noise
- reversible
- sealed tapered roller bearing
- high radial forces permitted on output shaft
- shaft seal up to 10 bar
- optional integral holding brake (multi-disc brake) or wheel brake (drum brake)
- switchable
 - freewheeling
 - half displacement
- for open and closed circuits

H/A 2388

Type MCR 15 F...F280Z-3X/B11M/...

Functional description (open and closed circuits)**Closed circuit**

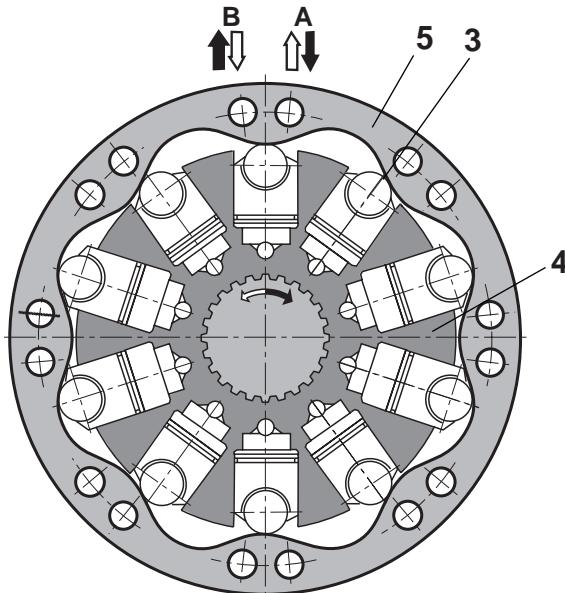

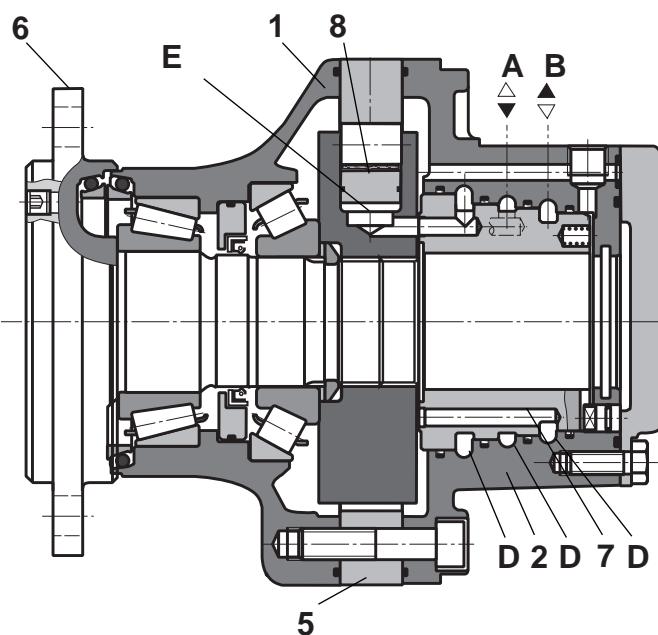

Minimum inlet pressure must be adapted to suit operating conditions; the following must be taken into consideration:
idling pressure, flow resistances, pump operation.
Minimum flow of the feed pump must be adapted to suit operating conditions.

Open circuit

Minimum inlet pressure must be adapted to suit operating conditions; the following must be taken into consideration:
idling pressure, flow resistances, pump operation.
The outlet pressure must be at least 2 bar greater than the pressure in the housing.

If the motor circuits are in series please consult the manufacturer.

Section, functional description

Hydraulic motors Type MCR are radial piston motors with a rotating shaft.

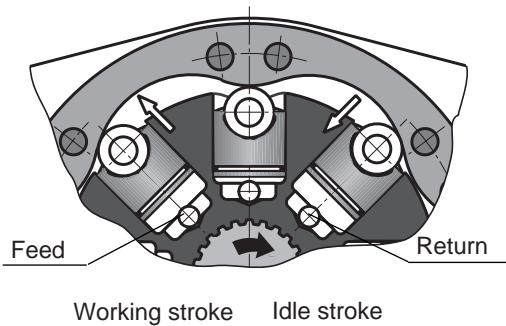

Construction

Two-part housing (1; 2), rotary piston assembly (3; 4) cam (5), output shaft (6) and control section (7)

Transmission

The rotor (4) is connected to the shaft (6) by means of splines. The pistons (3) are arranged radially in the rotor (4) and are supported on the cam plate (5) by way of rollers (8).

Torque generation

The number of working and idle strokes corresponds to the number of cams on the stroke curve.

Open loop control

The cylinder chambers (E) are connected to ports A or B by means of the axial bores and the annular passages (D).

Bearings

Tapered roller bearings capable of transmitting high axial and radial forces.

Freewheeling

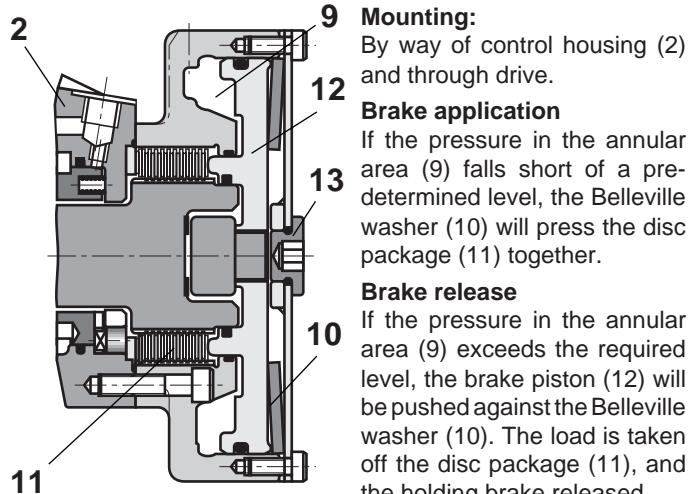

If the two ports A and B are connected with no pressure loading and a pressure of 2 bar is simultaneously applied to the housing by way of port "L", the pistons will be forced into the rotary piston assembly. The rollers will no longer be lying against the cam curve and it will be possible for the end of the shaft to be rotated.

Switching to half displacement

On certain models of radial piston motors halving of displacement is possible. This means that at working stroke only half the pistons are supplied with fluid by way of a valve in the control system. The remaining pistons are connected to the outlet side of the motor. When connected the motor will run at twice the speed but at half torque.

Mounting the brakes

Holding brake (multi-disc brake)

Mounting:

By way of control housing (2) and through drive.

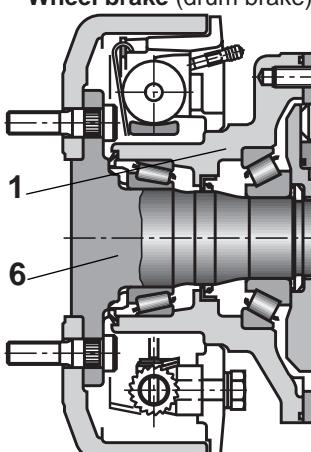

Brake application

If the pressure in the annular area (9) falls short of a pre-determined level, the Belleville washer (10) will press the disc package (11) together.

Brake release

If the pressure in the annular area (9) exceeds the required level, the brake piston (12) will be pushed against the Belleville washer (10). The load is taken off the disc package (11), and the holding brake released.

Wheel brake (drum brake)

Mounting

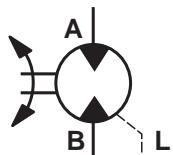

Directly onto output shaft (6) and flange housing (1).

Operating the brake

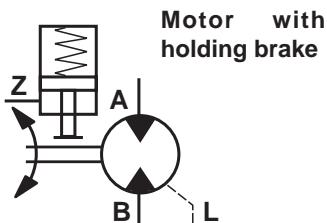

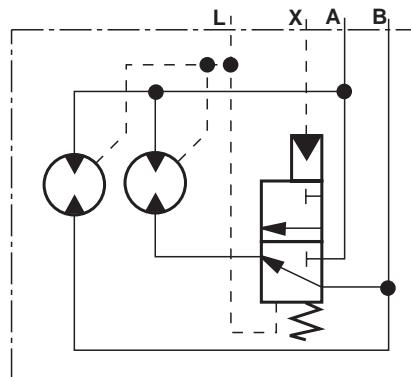

- **hydraulic** – for dynamic braking
- **mechanical** – as a holding brake

Ordering codes

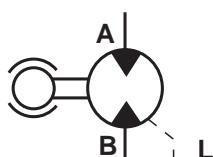

MCR	15			Z -3X /	M /			*	Further details in clear text
Flange housing									Studs
Compact version	= C								no code = without studs
Wheel version	= F								/S = with studs for wheel mounting

Type	Piston machine					
Model	Radial piston multi-stroke motor, switchable displacement					
Type code	MCR 15...					
Type of mounting	Flange mounting; face mounting					
Type of connection	Threaded, flange					
Mounting position	Optional					
Shaft load	See pages 6, 7					
Direction of rotation	Right / left - reversible					
Frame size	15					
Nominal size	1130	1250	1500	1780	2150	
Displacement V cm ³	1130	1250	1500	1780	2150	
Displacement flow at $n = 100$ rev/min/100 bar Q L/min	114	126	151	179	216	
Output torque ^{1), 7)}						
– spec. torque T Nm	1799	1990	2388	2833	3422	
(at $\Delta p = 100$ bar)						
– max. torque T Nm	8095	8955	9552	11332	13688	
Output torque ^{1; 7)}						
– min. speed n rev/min	5 to 10 when running smooth, depending on application					
– max. speed n rev/min	150	150	150	125	125	
– freewheeling n rev/min	300					
Output power ¹⁾						
– continuous power P kW	55	55	55	60	60	
Weight – motor m kg	93					
– motor with holding brake m kg	120					
– motor with wheel brake m kg	135					

Hydraulic

Nominal pressure	p	bar	250			
Pressure difference, cont. ^{2), 6), 7)} Δp						
– with mineral oil (HL, HLP)	bar	250				
Pressure difference, peak ^{3), 6), 7)} Δp						
– with mineral oil (HL, HLP)	bar		450		400	
Inlet pressure port "A" or "B" p	bar		470		420	
Summated pressure ^{4; 6)} port "A" + "B" p	bar		470		420	
Case drain pressure p	bar	10				
Fluid ⁵⁾	Mineral oil (HL, HLP) to DIN 51 524					
Fluid temperature range t °C			– 20 to 80			
Viscosity range ν mm ² /s			10 to 2000			
Fluid cleanliness	Max. permissible degree of contamination of the fluid to NAS 1638 class 9. We therefore recommend a filter with a minimum retention rate of $\beta_{10} \geq 75$.					

Brake

Holding brake (multi-disc brake)						
Holding torque T Nm	11 000					
Brake release pressure, min – max p bar	Min. 15 max. 30					
Wheel brake (drum brake)	See table page 8					

¹⁾ The data given apply after 100 hours running-in time

²⁾ Continuous operation

³⁾ Peak values may occur for a maximum duration of one second within an operating minute.

⁴⁾ In the return line we recommend $p_{min} = 15$ bar

⁵⁾ Environmentally friendly fluids HETG, HEPG, HEE to RE 90 221

⁶⁾ For connection in series, please consult the technical sales department.

⁷⁾ **Warning!** During the running-in time of the motor (min. 20 hours) motors should not be run unloaded at greater than 50% of maximum speed.

Technical data (mean values, measured at $v = 46 \text{ mm}^2/\text{s}$ and $t = 45^\circ\text{C}$)
Notes on the technical data
 T = torque in Nm Q = input flow in L/min Q_L = case leakage in L/min

– All torques given apply to run-in motors (see page 4, footnote 7)

– For "half displacement" operating mode multiply the torques and Q -values by 0.5.

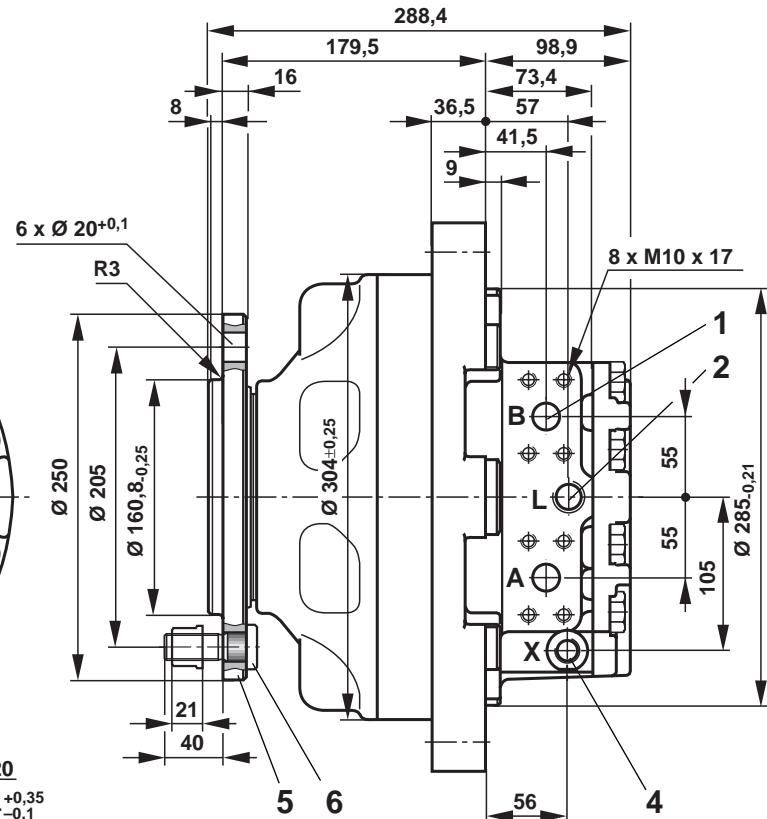

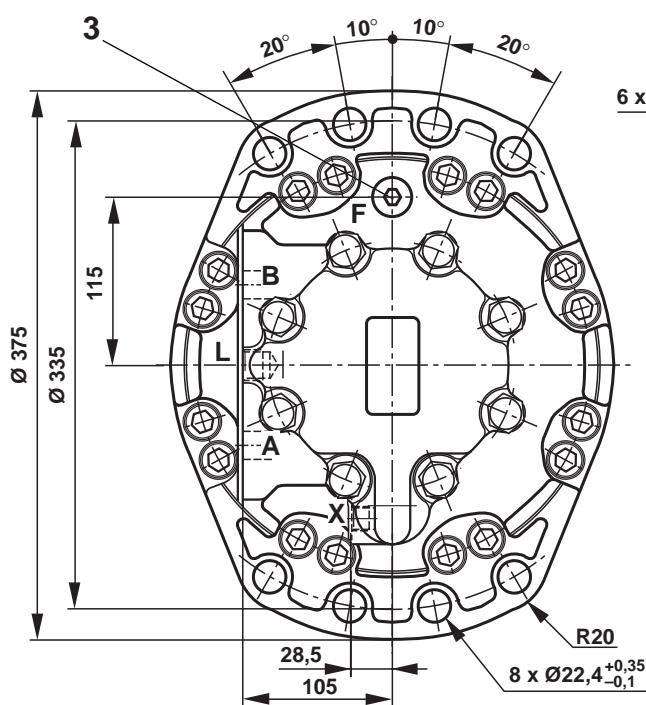

– The torques given for 50% displacement do not apply to both directions of rotation, but only to the preferred direction of rotation indicated (see page 4)
