## Hydraulic cylinder

### Types CDT3...F / CGT3...F

Series 1X

Nominal pressure:  
160 bar (16 MPa)

00001473

Type CDT3ME5/...F1X/...

## Features

- ISO 6020/2, DIN 24 554 and NF/ISO 6020/2
- 13 mounting styles
- Piston Ø: 25 to 200 mm
- Piston rod Ø: 12 to 140 mm
- Stroke length up to 2700 mm

## General guidelines

### Maximum pressure:

This series is designed to a standard to work at a dynamic continuous pressure of 160 bar for all mounting styles. Under certain conditions higher pressure is also permissible. For confirmation of the suitability to use at this higher pressure taking into account the requirements of the ISO 9001 quality standard, we require an exact application description, i.e. a specification document. When using a differential circuit or a meter-out throttle the pressure intensification must be taken into account. Dynamic pressures above 240 bar, within the cylinder, are not permitted.

### Minimum pressure:

Dependent on the application a certain minimum pressure is required to ensure correct operation of the cylinder. Without load a minimum pressure of 10 bar is recommended for differential cylinders, for low pressures and double rod cylinders, please consult ourselves.

### Piston rod:

The piston rod material, as standard, is a hard chrom plated hardened steel with high elasticity. This provides a high resistance against mechanical shocks and an optimum service life.

The threaded end is reduced in diameter and is therefore protected. The standards DIN 24554 and NF/ISO 6020/2 give a thread size per piston rod diameter. This guarantees that the full dynamic forces within the frame work of this standard can be transmitted. ISO 6020/2 additionally provides for the large (differential) piston rods, a second larger thread and deviating from DIN 24554 and NF/ISO 6020/2 different external threads as well as internal threads, lengthened piston rods or threaded ends are available. However when using smaller threads than those stated within the standards, it has to be taken into account that the maximum permissible pressure is limited and that with larger threads the assembly limits are taken into account. The end type „T“ to NF/ISO 6020/2 has pressure limitations, see page 39.

### Double roded cylinder with a through piston rod:

The dimensions stated within this catalogue relate to the draft standard.

This design style has a much higher friction than the „CD version“ with a single piston rod.

Both rod diameters in the standard version are identical. If the cylinder is so mounted that the rods are statically fixed and the body of the cylinder moves, then particular attention should be given to the side loadings caused by the cylinder's own weight.

### Seal versions:

As standard there are three seal versions available: „M“ (standard), „T“ (low friction) and „V“ (high temperature applications). For information regarding the application of these seals at various temperatures and speed ranges see page 3.

The seal installation areas conform to ISO 5597 for the „M“ piston seals, ISO 7425-1 for all piston seals and ISO 6195-C for all piston rod wipers.

The „M“ seal version has a hydrolysis proof wiper and can be used at high speeds when the pressure is less than 100 bar and the frequency is lower than 3 Hz.

Cylinders with longer strokes are preferably fitted with the type „M“ seals.

### Piston rod guide bush:

Manufactured from GGG-50 DIN 1693 gray cast iron and from piston rod diameter 40 mm as a cartridge, for small diameters in a screwed open design so that simple assembly is possible. For spare parts purposes a guide bush with pre-assembled seals is available, see page 43.

### Pistons:

Design with an integrated cushioning pin, screwed onto the piston rod, glued and mechanically locked by means of a grub screw.

The seal installation chambers are to ISO 7425-1, and are identical for the seal versions „M“, „T“ and „V“. They can therefore be exchanged without having to replace the piston.

### Cover / tube seals:

The closed design of the seal chamber and the tube being centralised to both sides of the seal ensure that, especially for longer stroke cylinders, the optimum sealing conditions are achieved.

### Stroke tolerances:

In accordance with ISO 8131 for stroke lengths up to 1250 mm, a stroke tolerance of 0/+2 mm is permissible; for longer strokes please consult ourselves.

A tolerance of ±0,3 mm is available as an option, smaller tolerances for tie rod cylinders is not sensible.

### Recommended maximum strokes:

The strokes stated on page 3 ensure trouble-free operation under all application conditions with a maximum pressure of 160 bar. In all cases the buckling loads have to be checked.

Longer strokes are available on request, with lower pressures and when only pulling loads have to be considered.

### Minimum strokes:

For the „MT4“ mounting style there has to be a minimum stroke due to the width of the trunnions, see page 3.

When using end position cushioning a minimum stroke has to be considered (see page 3). With stroke lengths that are less than the cushioning length, we recommend that cylinders without cushioning are used.

### Pipe connections:

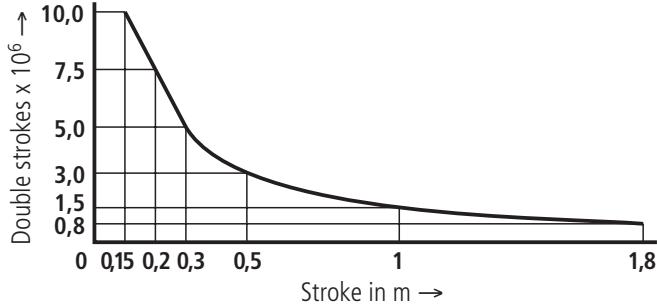

We supply BSP pipe threads to ISO 8138 and ISO 6020/2, the counter sinks are to ISO 1179/1. Enlarged connections are available as an option. Metric pipe connections or SAE flanges connections are available on request.

## General guidelines

### Service life:

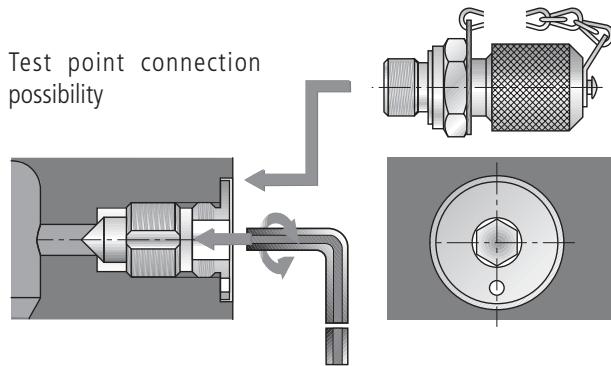

The Rexroth cylinders conform to the recommendations of an inter-professional standardisation committee and Hydraulics Association with regard to reliability:

≥ 10 000 000 double strokes under no load, continuous operation, or 3000 km stroke length at 70% of the operating pressure, without any load on the piston rod, with a maximum speed of 0.5 m/s and a failure rate of less than 5%.

### Bleeding:

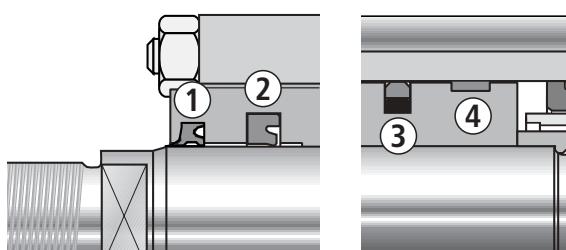

As standard a patented safety bleeding system, with regard to unintended removal from the head or base, (for piston diameters larger than 32 mm) is supplied. The dimensions to ISO 6020/2 are maintained. The connection makes it possible to fit a test point (with check valve) or for contamination free bleeding.

### Comparison ISO / DIN / NF E

- ISO 6020/2 comprises of 12 mounting styles
- DIN 24 554 comprises of 5 mounting styles
- NF/ISO 6020-2 comprises of 12 mounting styles

- The mounting styles MP5, ME5, ME6, MT4 and MS2 to ISO, DIN and NF E are interchangeable.
- In addition to the type CD.. double acting cylinders the type CG.. double roded cylinders have been incorporated into this series.

### Notes

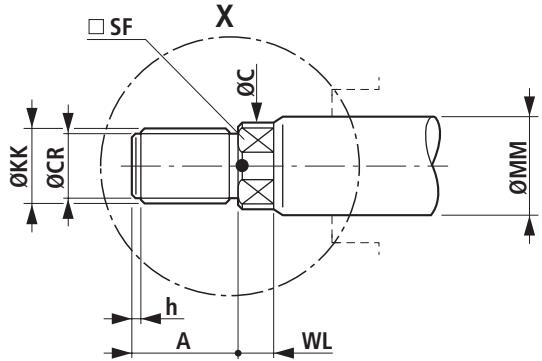

- 1) Thread for piston rod ends „F“ and „H“
- 2) Thread for piston rod ends „D“ and „K“
- 3) For piston rod ends „E“ and „T“ see page 39
- 5) Dim. „H“ is always at the connection port location
- 6) For connection port locations and bleeding see page 27

- 7) For tightening torques see page 42
- 9) Dim. „XV“ in mm, always to be stated in clear text
- 11) Piston Ø 25 and 32 mm: Dim. „H“ take the connection port locations „2“ and „4“ into account

## rain connection / enlarged pipe connections

### ain connection

using high technology seals the need of having a drain connection generally unnecessary. The drain connection is only required when, e.g. the extension speed is more than 2 x the retraction speed (with long strokes), when continuously pressurised, a drag oil collection connection is recommended. For extension speeds higher than 5 x the retraction speed, consultations are required.

### Enlarged pipe connections

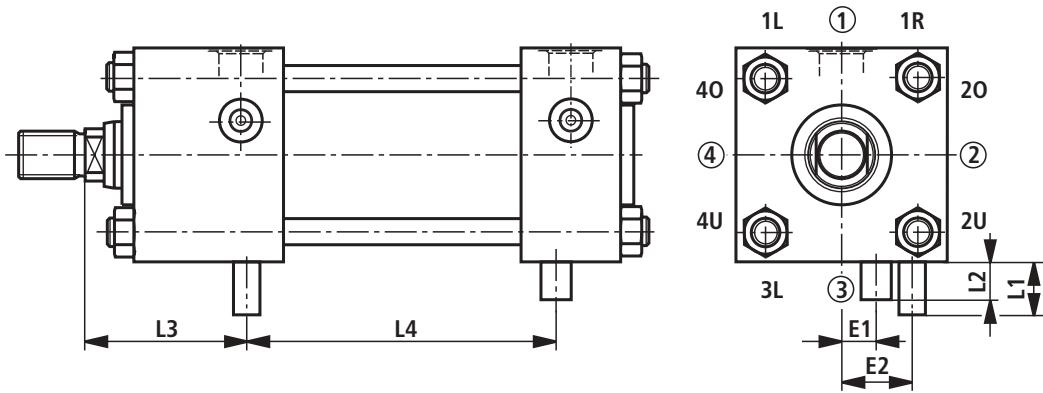

The oil connections for this series are to the standard generously sized; however, with higher speeds the  $\Delta P$  can be reduced by using larger oil connections, but in some instances the standard dimensions cannot be maintained, see table.

Not possible for mounting styles ME 5 / 6 with port locations 2 or 4.

## Coupling

For pistons Ø 40 - 63 mm

Scope of supply for pistons Ø 40 to 63 mm  
Coupling AB-E 20-11/K3, G 1/8  
with NBR seal  
Material No. R900014363  
Coupling AB-E 20-11/K3V, G 1/8  
with FKM seal  
Material No. R900024710

For pistons Ø 80 - 200 mm

Scope of supply for pistons Ø 80 to 200 mm  
Coupling AB-E 20-11/K1, G 1/4  
with NBR seal  
Material No. R900009090  
Coupling AB-E 20-11/K1V, G 1/4  
with FKM seal  
Material No. R900001264

## Notes

For pressure measurement or bleeding.

For installation in the bleed/measuring port. Coupling with check valve function, i.e. it can also be connected when pressure is present.

## Buckling

### Buckling:

cylinder that is subject to pressure forces susceptible to buckling. Due to this the stroke length, dependent on the pressure, mounting style, the guidance quality of the moved mass, is limited. Stated within the table are theoretical stroke lengths = L in relation to the pressure and diameter.

These values divided by the mounting and load guidance factors = K gives the maximum permissible stroke = H. If this length is exceeded then the cylinder will buckle and be damaged. If the required stroke is, however, longer than this value then this factor can be overcome by selecting a different mounting style, load guidance or by using a longer piston diameter.

### 1. Calculation according to Euler

$$F = \frac{\pi^2 \cdot E \cdot I}{\nu \cdot L_K^2} \text{ when } \lambda > \lambda g$$

### 2. Calculation according to Tetmajer

$$F = \frac{d^2 \cdot \pi (335 - 0.62 \cdot \lambda)}{4 \cdot \nu} \text{ when } \lambda \leq \lambda g$$

### Explanation:

$E$  = Modulus of elasticity in N/mm<sup>2</sup>  
 $= 2.1 \times 10^5$  for steel

$I$  = Moment of inertia in mm<sup>4</sup> for a circular cross-sectional area

$$= \frac{d^4 \cdot \pi}{64} = 0.0491 \cdot d^4$$

$\nu$  = 3.5 (safety factor)

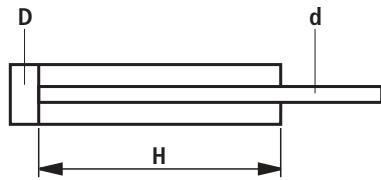

$L_K$  = Free buckling length in mm  
 (depending on the mounting styles,  
 see page 31)

$d$  = Piston rod Ø in mm

$\lambda$  = Slenderness ration

$$= \frac{4 \cdot L_K}{d} \quad \lambda g = \pi \sqrt{\frac{E}{0.8 \cdot R_e}}$$

$R_e$  = Yield strength of the piston rod material

$$L = H \cdot K$$

or

$$H = \frac{L}{K}$$

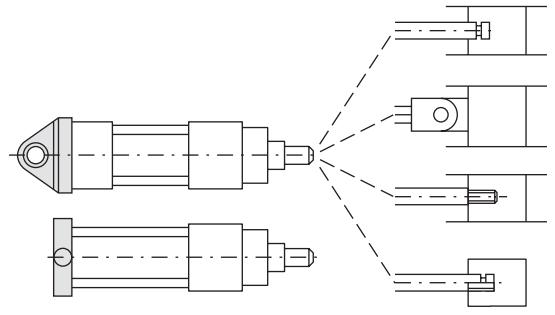

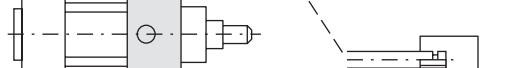

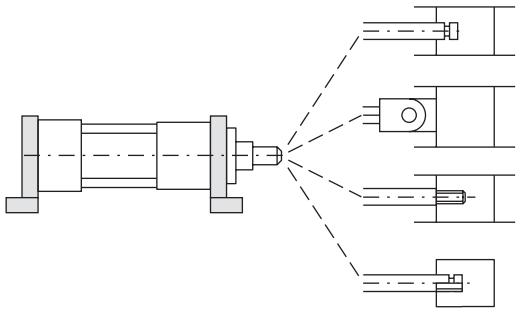

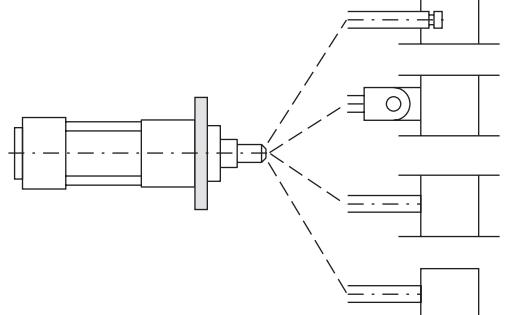

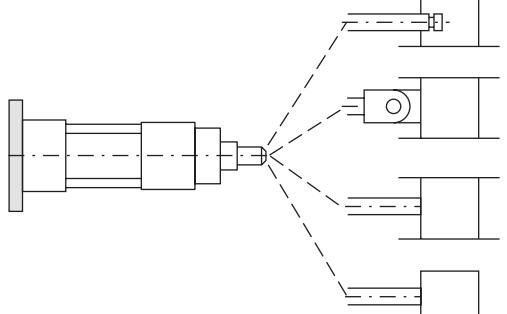

H = Stroke

L = Theoretical stroke value from table

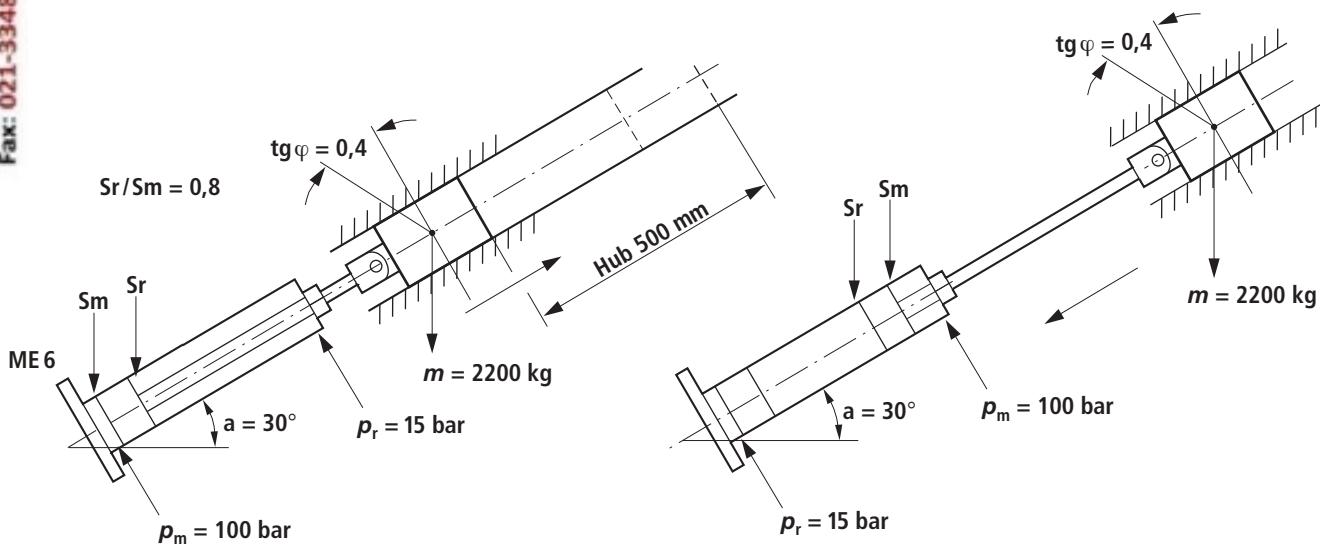

K = Load guidance factor on page 31

## calculation cylinders

### Example:

Stroke time 2 s

Load friction co-efficient = 0.4

Available pressure  $p_m$  = 100 bar

Return pressure  $p_r$  = 15 bar

$Sm$  = Surface area on which the working pressure is applied

$Sr$  = Surface area on which the return pressure is applied

$m$  = Total moved mass

$v$  = Maximum velocity

$g$  = 9.81 m/s<sup>2</sup>

$l_a$  = Cushioning length, see page 34

### To be determined:

Piston and piston rod diameter

### Piston rod; extending:

Total efficiency  $\eta = \eta_1 \cdot \eta_2$

$\eta_1$  = Cylinder efficiency = 0.9 (estimated)

$\eta_2$  = System efficiency

$$\begin{aligned} \eta_2 &= \frac{p_m \cdot Sm - p_r \cdot Sr}{p_m \cdot Sm} \\ &= \frac{p_m \cdot Sm - 0.8 \cdot p_r \cdot Sm}{p_m \cdot Sm} \\ &= \frac{p_m - 0.8 \cdot p_r}{p_m} \\ &= \frac{100 - 0.8 \cdot 15}{100} \\ &= 0.88 \end{aligned}$$

### The force required to move a mass:

$$\begin{aligned} F &= 0.4 \cdot m \cdot g \cdot \cos \alpha + m \cdot g \cdot \sin \alpha \\ &= 0.4 \cdot 2200 \cdot 9.81 \cdot 0.866 + 2200 \cdot 9.81 \cdot 0.5 \\ &= 18270 \text{ N} \\ &= 18.27 \text{ kN} \end{aligned}$$

(F = Frictional force plus the potential energy)

Craft 18.27 kN at  $\eta = 0.79$  and  $p_m = 100$  bar this results in a cylinder piston diameter = 63 mm

### Piston rod; retracting:

$$\begin{aligned} F &= 0.4 \cdot m \cdot g \cdot \cos \alpha - m \cdot g \cdot \sin \alpha \\ &= 0.4 \cdot 2200 \cdot 9.81 \cdot 0.866 - 2200 \cdot 9.81 \cdot 0.5 \\ &= -3315 \text{ N} \\ &= -3.3 \text{ kN} \end{aligned}$$

(F = Frictional force plus the potential energy)

No force problems when retracting

### Checking the buckling length:

The table on page 30 results for a  $p_m = 100$  bar and a cylinder size of 63 / 28 a L = 719 mm

For ME 6, K = 1.5 (page 31) the buckling length H = L / K = 719 / 1.5 = 479 mm

The cylinder buckles

There are 2 possibilities:

- A 45 mm piston rod diameter, L = safe from buckling
- Change the mounting style, e.g. MS2 with a co-efficiency of 0.7

## End position cushioning

### Checking the end position cushioning:

Average speed  $0.5 / 2 = 0.25 \text{ m/s}$

Max. speed  $0.267 \text{ m/s}$

Cushioning capacity when the piston rod is being extended =

$$\frac{m \cdot v^2}{2} - m \cdot g \cdot La \cdot \sin \alpha = \frac{2200 \cdot 0.267^2}{2} - 2200 \cdot 9.81 \cdot 0.028 \cdot 0.5 = -224 \text{ joules}$$

No cushioning problems when extending

Cushioning capacity when the piston rod is being retracted =

$$\frac{m \cdot v^2}{2} + m \cdot g \cdot La \cdot \sin \alpha = \frac{2200 \cdot 0.267^2}{2} + 2200 \cdot 9.81 \cdot 0.025 \cdot 0.5 = 348 \text{ joules}$$

The diagram on page 36 gives a result of 445 joules for  $P_m = 100 \text{ bar}$ ,  $v_{\max} = 0.4 \text{ m/s}$ , so  $0.267 \text{ m/s}$  has to be cushioned

$$EU = E_{\max} \cdot \frac{v_u}{v_{\max}} = 445 \cdot \frac{0.267}{0.4} = 297 \text{ joules}$$

The cylinder cannot absorb this energy;

The next larger diameter of  $80 / 56$  has to be selected.

### End position cushioning:

For speeds above 20 mm/s we recommend the use of cushioning, so that the energy can be dissipated without the use of additional means. Thereby damage to the cylinder and the surrounding area is prevented. The CDT3 series is fitted with a self-adjusting progressive cushioning system.

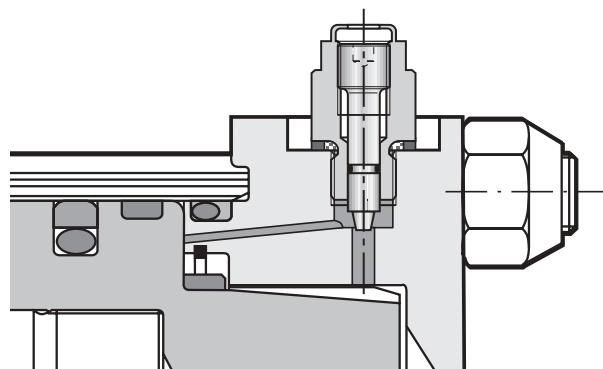

The advantages of this cushioning system are:

- Progressive delay.
- Short cushioning times.
- The cushioning length is dependent on the speed.
- Low cushioning pressures and no pressure peaks, therefore the safety and the service life of the cylinder and its surroundings are increased.
- Non-sensitive characteristics with changes in the pressure, the temperature and the moved mass.
- Automatic limitation of the piston's end stop velocity: increased safety and reliability.
- A special check valve and a floating sleeve makes possible immediately high flows giving fast end stop positioning.
- The negative effects of adjustable cushioning by means of a screw are prevented (shocks, adjustment changes due to oscillations or untrained personnel, leaks at the screw, etc.)
- Application range:  
30 to 160 bar operating pressure = Cushioning D,  
20 to 70 bar for cushioning low energies and for short cushioning times = Cushioning L (piston diameters less than 125 mm).

Cushioning type E is the same as type D but includes a throttle screw to adjust the cushioning times; care however has to be taken to ensure that the maximum recommended end stop speed is not exceeded. The maximum energies shown within the curves are only valid when the throttle valve is fully closed.

For special applications, e.g. very short stroke times, high speeds, masses or energies, we can provide perforated ring cushioning „BT“; additional information is available on request.

Each cylinder that is fitted with progressive cushioning must use its entire stroke length. When using an external fixed or adjustable end stop special measures have to be taken, please consult ourselves.

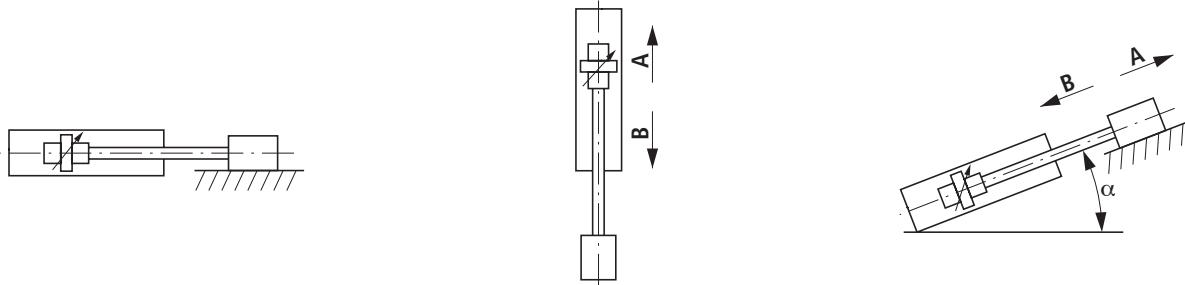

## End position cushioning

### Cushioning capacity:

When decelerating masses via the end position cushioning, the maximum design cushioning capacity must not be exceeded. In conjunction with this, the kinetic energy of the moved mass has been calculated and then compared with the permissible values indicated within the diagrams shown on pages 37 to 39.

### Determining the energy

$$E = \frac{1}{2} m \cdot v^2$$

$$\text{Extending (A): } E = \frac{1}{2} mv^2 - mg \cdot l_a$$

$$\text{Extending (A): } E = \frac{1}{2} mv^2 - mg \cdot l_a \cdot \sin \alpha$$

$$\text{Retracting (B): } E = \frac{1}{2} mv^2 + mg \cdot l_a$$

$$\text{Retracting (B): } E = \frac{1}{2} mv^2 + mg \cdot l_a \cdot \sin \alpha$$

E	[Nm] [joules]	For maximum value see page 37

\* If the v<sub>max</sub> is exceeded then please contact ourselves.

## End position cushioning

$$EU = E_{\max} \cdot \frac{v_u}{v_{\max}}$$

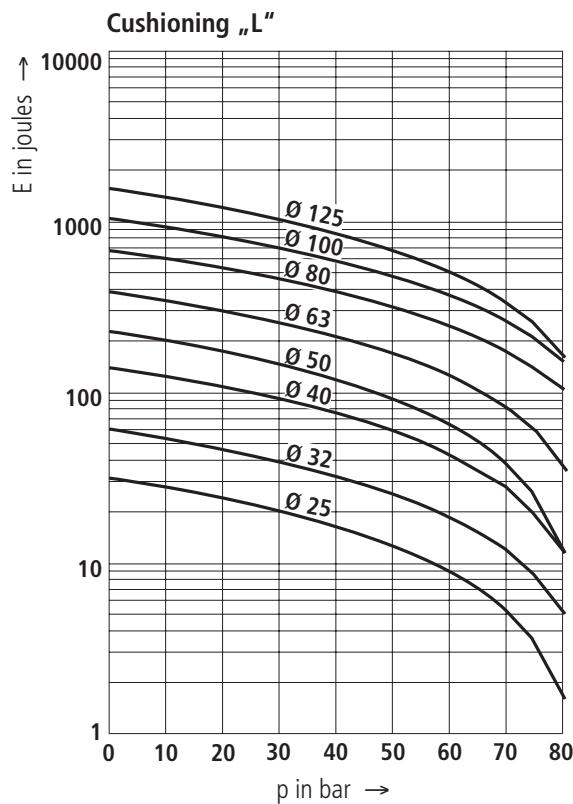

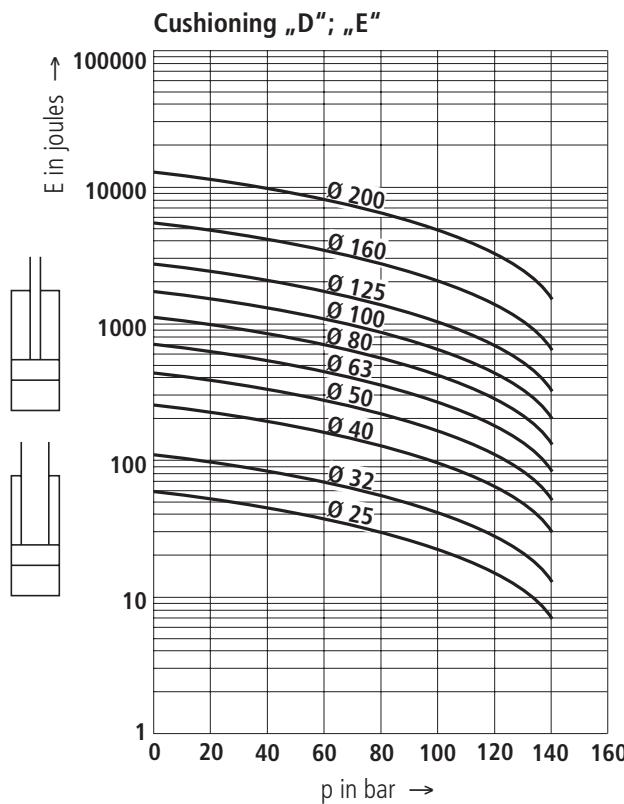

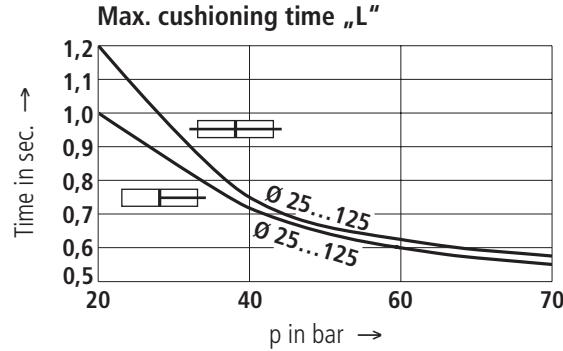

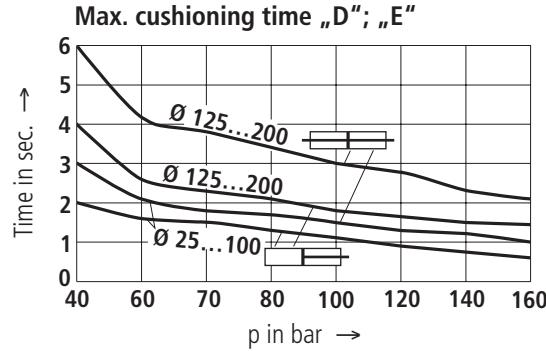

EU = Absorbed energy

$E_{\max}$  = Max. energy, see characteristic curves

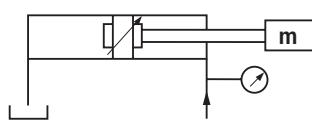

$v_u$  = Stroke velocity

$v_{\max}$  = Max. velocity for seal version „M“

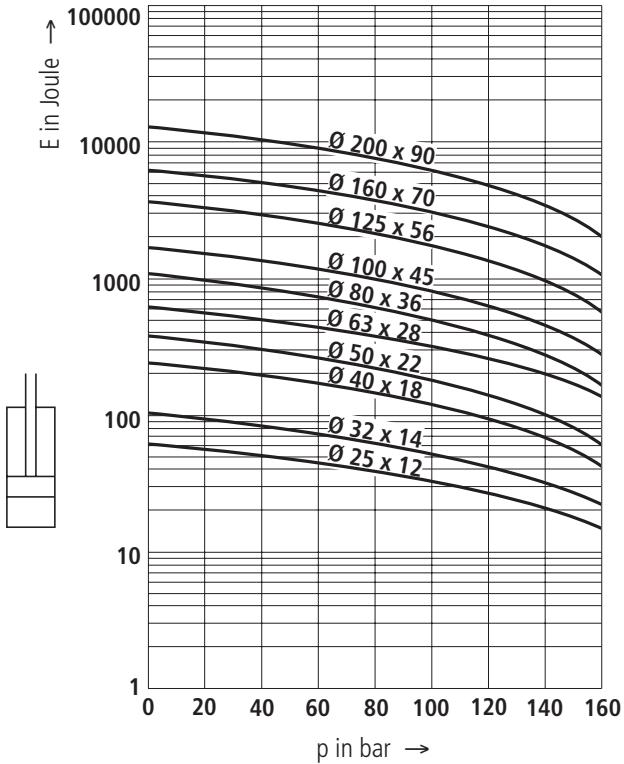

The values stated on page 34 are valid for the maximum velocities for the M type seals and a closed throttle.

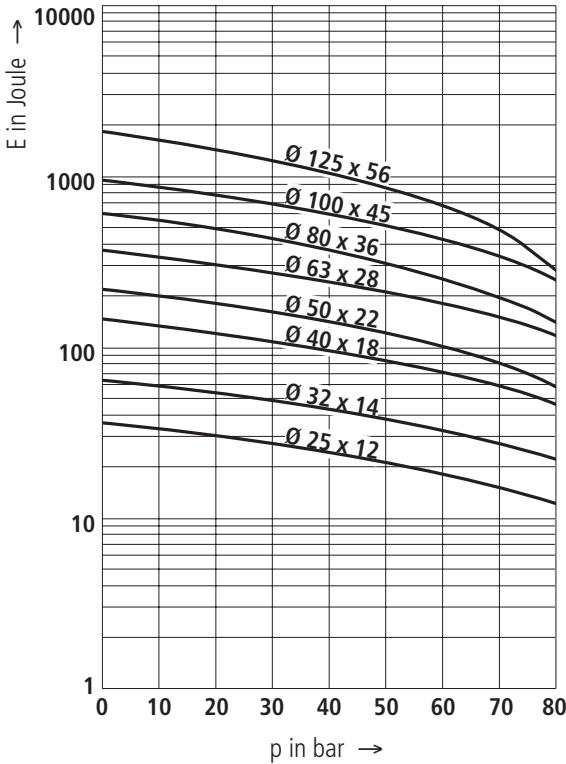

## End position cushioning

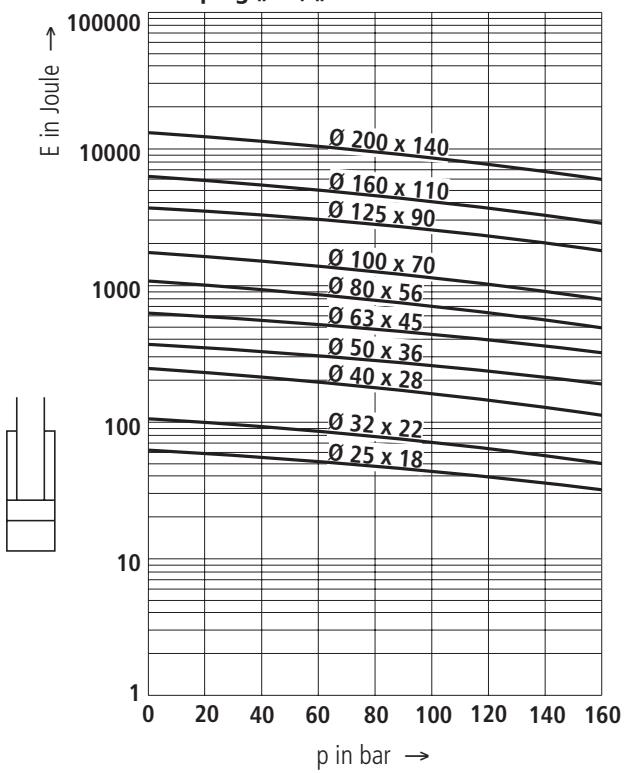

Damping „D“; „E“

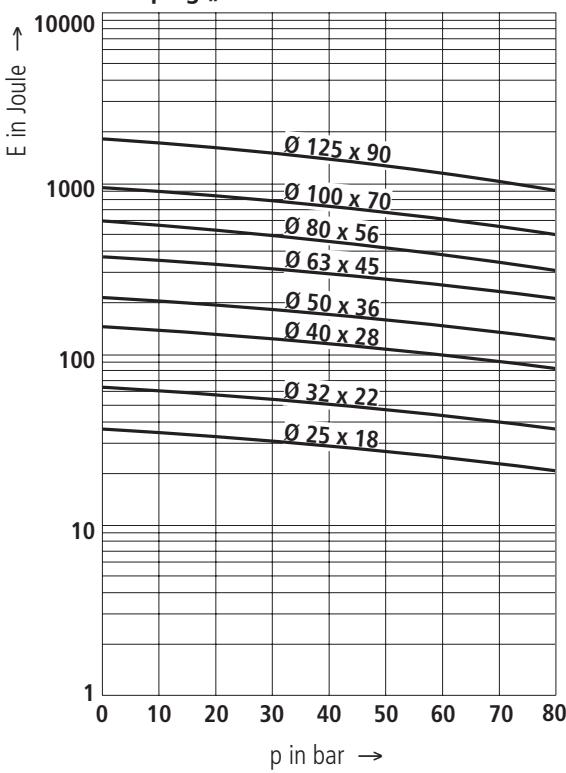

Damping „L“

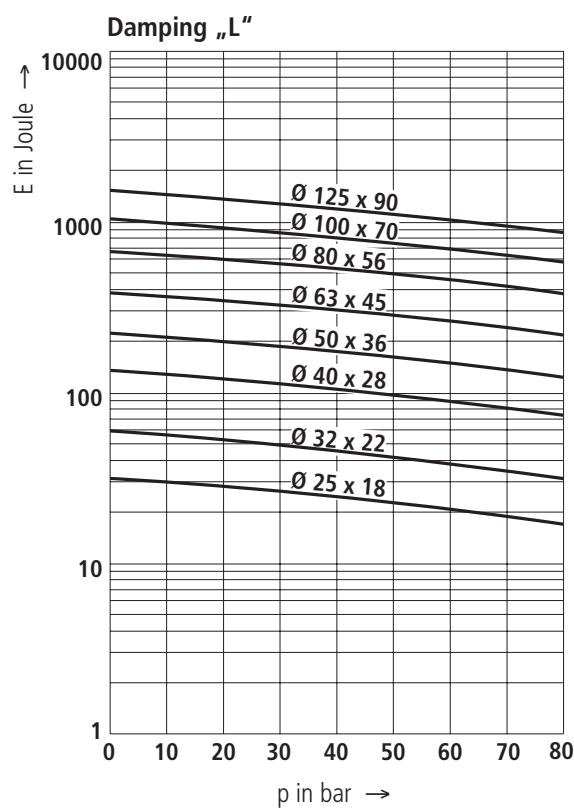

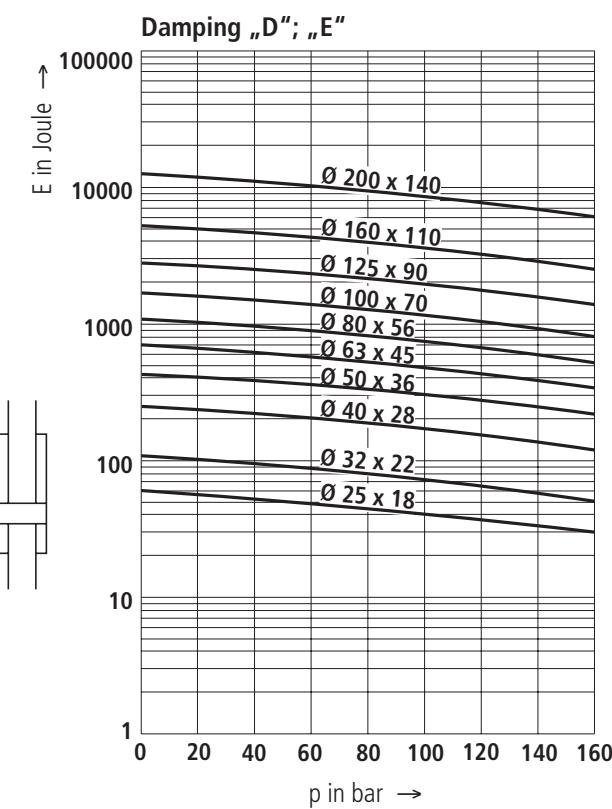

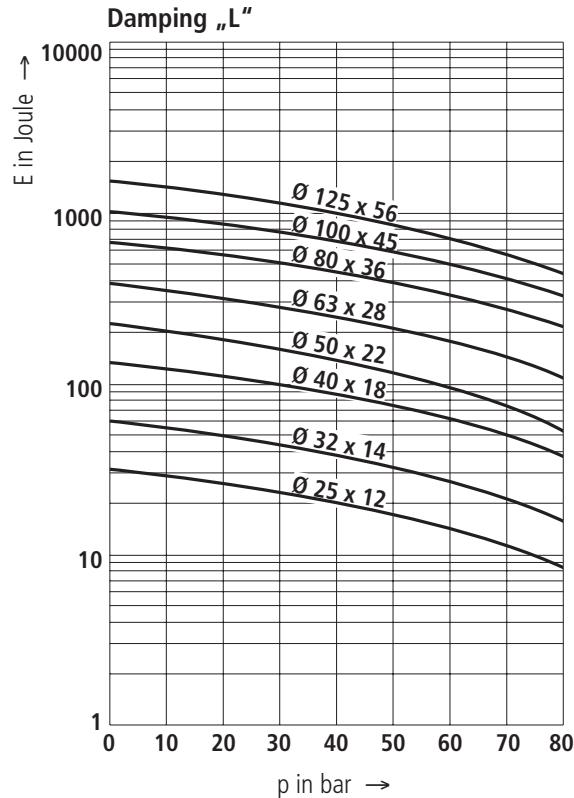

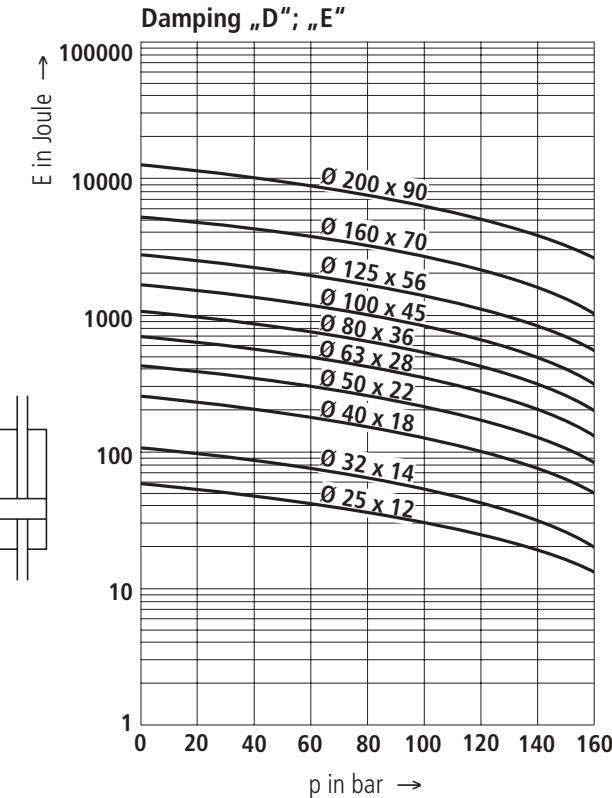

Damping „D“; „E“

Damping „L“

## End position cushioning

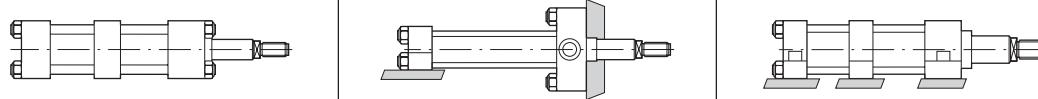

## Supports / stop tubes

### tie rod clamping block:

tie rod clamping blocks are required for longer stroke lengths to stabilise the tie rods. However, in some cases the use cylinders of a wedged design (without tie rods) is recommended. Please consult yourselves.

### External supports:

Long stroke cylinders tend to bend which results in increased friction and increased wear. To prevent this from occurring a free support should be designed into the machine.

Piston Ø AL	Stroke > mm	Stroke > mm	Stroke > mm
25	900	800	1000
32	1200	900	1200
40	1500	1000	1500
50	1800	1100	1600
63	2100	1300	1800
80	2400	1500	2000
100	2700	1700	2500
125	—	2000	—
160	—	2200	—
200	—	2500	—

### Internal stop tubes:

With long stroke cylinders it makes sense to fit stop tubes to lower bearing loads. This increases the distance between the piston and guide bush which in turn increases the stability of the cylinder, this in turn increases the cylinder's service life and functionality. This measure is not required for vertically hanging cylinders, that are suitably guided and are not subject to side loads.

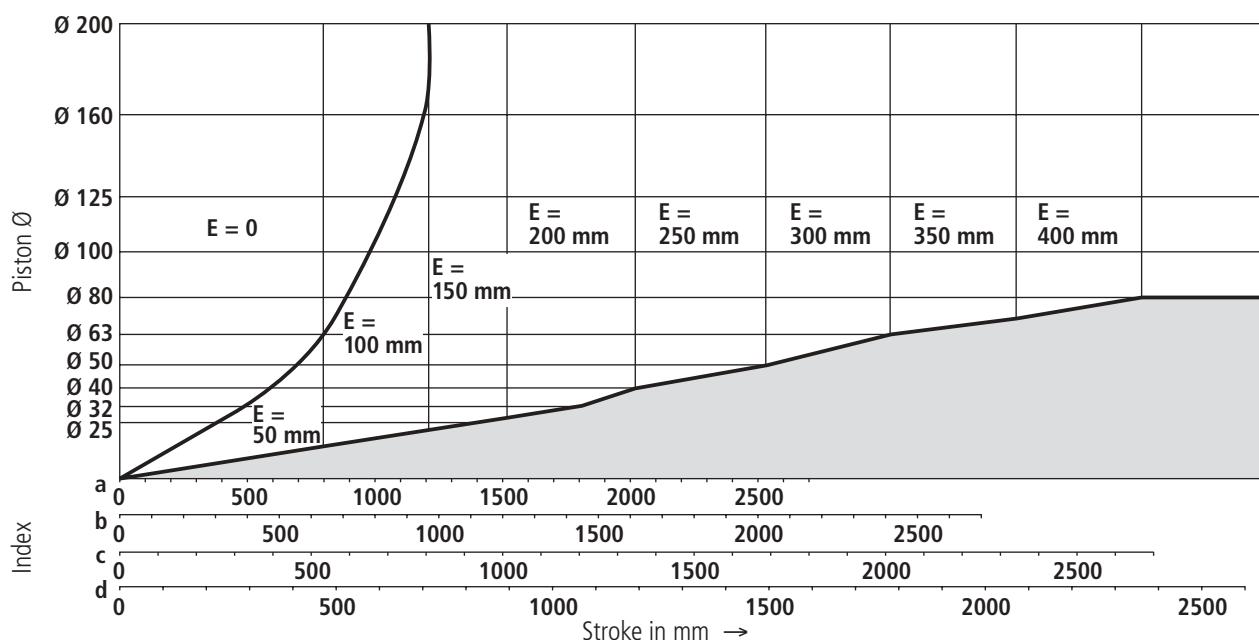

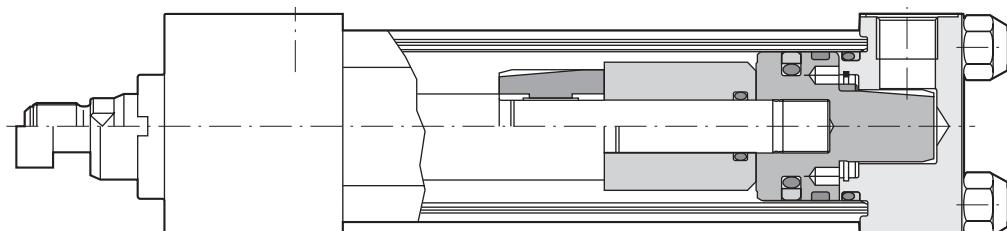

Stop tube lengths are dependent on the mounting style and the load

guidance. The stop tubes are available in 50 mm steps for all diameters other than the sizes 25 x 12 und 32 x 14, where the stroke lengths are limited.

M seals are preferred due to the side loads.

When ordering, the installation length has to be stated, i.e. the sum of the working stroke + the stop tube length.

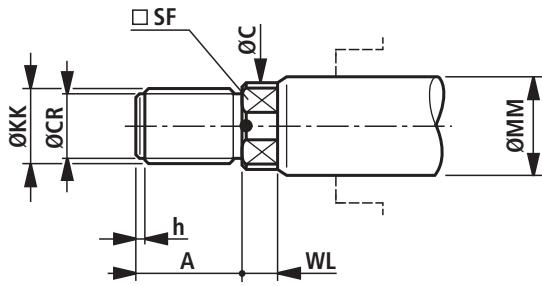

For the index see page 31.

Other piston rods on request

Standard versions can be **modified** as an option e.g.:

\* With a pulling load

S = Piston rod extension

## dditional information

### ounting styles:

#### X5:

is mounting style, see ISO 6099, to NFE 48.016, makes assembly possible via 4 threaded holes in the head.

#### S2:

With a key; which is located in a keyway under the feet which has to be provided by the purchaser, to DIN 6885 T1, form A, which is used to unload the 4 fixing bolts, see page 12; the standard is in preparation.

- Subplate mounting: An oil connection, via the mounting plate, with an O-ring and counter bore in connection orientation 3 is possible on request.
- Connection orientation: The locations 2 and 4 can lead to assembly problems (connection fitting / fixing screws) and are therefore not included within the standard programme.

### Fixing screws:

Screws to class 12.9 and nuts to a minimum of class 80 are required to fix cylinders with mounting styles MX..-/ME..-/MS... The tightening torques are stated on the relevant dimension page.

### Commissioning:

Catalogue sheet RE 07100 is to be taken into account for assembly commissioning and the maintenance of hydraulic cylinders.

A cylinder can only optimally fulfill its function when the following basic rules have been complied with during assembly and commissioning:

- Correct cylinder alignment prevents alignment errors, the piston rod from jamming and early wear.
- Avoid side loads on the piston rod
- Carefully clean the pipework and connection threads before assembly
- Bleed the system and use good, clean filtered oil. It is recommended that the cylinder is fitted with the piston rod fully retracted, and to mechanically adjust the zero stroke of the load, then fully extend the piston rod and then adjust the stroke using the fixing between the moved mass and the piston rod ends.

### Repairs:

The spare parts kits are to be fitted in accordance with the Rexroth instructions.

### Cylinder surface protection:

The cylinders are given an undercoat before they are delivered to give protection against the formation of rust. Other paints can be subsequently applied without any problems. On request (as an option) they can be supplied painted with a white epoxy paint finish, this is recommended for applications in damp and aggressive environments.

### Storage:

Rexroth cylinders are tested in the factory with mineral oil to ISO VG 046. After they have been drained the ports are plugged. The residual oil in the inner chamber protects the cylinder against the formation of rust for at least one year when stored in a dry and temperaturised

location. For cylinders with long strokes and in special cases e.g. damp, warm or cold surroundings, long term storage, large temperature fluctuations, consultations are necessary. When stored for more than two years we recommend that the seals are replaced before commissioning is carried out.

### Accessories:

The CGKA swivel eye can be supplied pre-assembled on the cylinder. All other accessories are to be separately ordered. These are suitably protected for storage purposes.

### Mounting play:

Movable mounts have, due to their tolerances, mechanical play and are therefore not suitable for use in closed loop circuits where high positional accuracy is required. We would be pleased to give recommendations on request.

### Metal wipers:

The use of a metal wiper is recommended where, due to heavy contamination, a standard wiper would be destroyed.

### Integrated position measuring systems:

This series can be fitted with an ultra-sonic based position measuring system, there are also a multitude of signal outputs available. Further information is available on request. Certain standardised dimensions can however not be maintained.

### Limit switches:

Inductive limit switches can be catered for, however in certain cases special heads and bases are required. Consultations are required.

### Piston rod clamping unit:

To lock the piston rod mechanically in a fixed position for longer periods of time in the depressurised condition or due to safety reasons, a piston rod clamping mechanism can be mounted onto the cylinder head. It must however not be used as a brake unit.

### Special applications:

Special applications, e.g. a three position cylinder (base on base), single acting cylinders that have air on one side are available.

### CD-ROM:

In addition to this catalogue, we have our CD-ROM with cylinder calculations and DXF (files);

### Internet:

Further information can also be obtained via the Internet:  
[www.boschrexroth.de](http://www.boschrexroth.de)

## Additional information

---

### Standards:

#### **ISO 6020/2:**

Interchangability dimensions for 160 bar cylinders with a single rod – part 2: Compact series for piston rod diameters of 25 to 200 mm.

#### **DIN 24 554:**

As ISO 6020/2 but with a limited selection of mounting styles and piston rod threads, requested by a large number of designers and large consumers for rationalisation reasons.

#### **NFE 48.016:**

As DIN 24 554, however additionally with the MX 5 mounting style, spigot on the piston rod end and cylinders with a through piston rod.

#### **ISO 6020/3:**

Interchangability dimensions for 160 bar cylinders with a single rod – part 2: Compact series for piston rod diameters of 250 to 500 mm.

#### **ISO 6099:**

Description and mounting style codification and their dimensions.

#### **ISO 6195:**

Installation chambers for piston rod wipers with linear movement – dimensions and tolerances.

#### **ISO 5597:**

Installation chambers for piston and piston rod seals.

#### **ISO 7425/1:**

Installation chambers for seals manufactured from plastic strengthened elastomers – part 1: Installation dimensions for piston seals.

#### **ISO 8131:**

160 bar cylinders with a single piston rod, compact series, tolerances.

#### **ISO 8133:**

160 bar cylinders with a single piston rod, compact series, tolerances, accessories, interchangability dimensions.

#### **ISO/FDIS 8138:**

160 bar cylinders with a single piston rod, compact series, oil connection dimensions.

#### **ISO 6547:**

Installation chambers for piston seals and guide strips – dimensions and tolerances.

#### **ISO 3320:**

Dimensions for pistons and piston rods – metric version.

#### **ISO 3322:**

Nominal pressures.

#### **ISO 4393:**

Piston stroke, basic series/preferred series

#### **ISO 4395:**

Piston rod end thread types and dimensions.

#### **DIN:**

Standardisation for Germany.

#### **Afnor:**

Standardisation for France.

#### **NFE:**

Standard taken from Afnor.
